

Problem

Comparators are used to compare two objects. In this challenge, you'll create a comparator and use it to sort an array.

The `Player` class is provided for you in your editor. It has **2** fields: a ***name*** String and a ***score*** integer.

Submissions

Given an array of ***n*** `Player` objects, write a comparator that sorts them in order of decreasing score; if **2** or more players have the same score, sort those players alphabetically by name. To do this, you must create a `Checker` class that implements the `Comparator` interface, then write an `int compare(Player a, Player b)` method implementing the `Comparator.compare(T o1, T o2)` method.

Input Format

Input from stdin is handled by the locked stub code in the `Solution` class.

Leaderboard

The first line contains an integer, ***n***, denoting the number of players.

Each of the ***n*** subsequent lines contains a player's ***name*** and ***score***, respectively.

Constraints

- $0 \leq \text{score} \leq 1000$
- **2** players can have the same name.
- Player names consist of lowercase English letters.

Discussions

Output Format

You are not responsible for printing any output to stdout. The locked stub code in `Solution` will create a `Checker` object, use it to sort the `Player` array, and print each sorted element.

Editorial

Sample Input

```
5
amy 100
david 100
heraldo 50
aakansha 75
aleksa 150
```

Sample Output

```
aleksa 150
amy 100
david 100
aakansha 75
heraldo 50
```
