

Problem

Java's `System.out.printf` function can be used to print formatted output. The purpose of this exercise is to test your understanding of formatting output using `printf`. To get you started, a portion of the solution is provided for you in the editor; you must format and print the input to complete the solution.

Input Format

Every line of input will contain a `String` followed by an integer. Each `String` will have a maximum of **10** alphabetic characters, and each integer will be in the inclusive range from **0** to **999**.

Output Format

In each line of output there should be two columns: The first column contains the `String` and is left justified using exactly **15** characters. The second column contains the integer, expressed in exactly **3** digits; if the original input has less than three digits, you must pad your output's leading digits with zeroes.

Sample Input

```
java 100
cpp 65
python 50
```

Sample Output

```
=====
java      100
cpp       065
python    050
=====
```

Explanation

Each `String` is left-justified with trailing whitespace through the first **15** characters. The leading digit of the integer is the **16th** character, and each integer that was less than **3** digits now has leading zeroes.

Language

Java 7

```
1 import java.util.Scanner;
2
3 public class Solution {
4
5     public static void main(String[] args) {
6         Scanner sc=new Scanner(System.in);
7         String [] arr = new String[3];
8         for(int i=0;i<3;i++){
9             String s1=sc.next();
10            int x=sc.nextInt();
11            String s = String.format("%-15s", s1);
12            s += String.format("%03d", x);
13            arr[i] = s;
14        }
15        System.out.println
16        ("=====")
```
