

Problem

This exercise is to test your understanding of Java Strings. A sample String declaration:

```
String myString = "Hello World!"
```

Submissions

The elements of a String are called characters. The number of characters in a String is called the length, and it can be retrieved with the `String.length()` method.

Given two strings of lowercase English letters, **A** and **B**, perform the following operations:

1. Sum the lengths of **A** and **B**.
2. Determine if **A** is lexicographically larger than **B** (i.e.: does **B** come before **A** in the dictionary?).
3. Capitalize the first letter in **A** and **B** and print them on a single line, separated by a space.

Leaderboard

Input Format

The first line contains a string **A**. The second line contains another string **B**. The strings are comprised of only lowercase English letters.

Output Format

There are three lines of output:

For the first line, sum the lengths of **A** and **B**.

For the second line, write Yes if **A** is lexicographically greater than **B** otherwise print No instead.

For the third line, capitalize the first letter in both **A** and **B** and print them on a single line, separated by a space.

Editorial

Sample Input 0

```
hello
java
```

Sample Output 0

```
9
No
Hello Java
```

Explanation 0

String **A** is "hello" and **B** is "java".

A has a length of **5**, and **B** has a length of **4**; the sum of their lengths is **9**.

When sorted alphabetically/lexicographically, "hello" precedes "java"; therefore, **A** is not greater than **B** and the answer is No.

When you capitalize the first letter of both **A** and **B** and then print them separated by a space, you get "Hello Java".
