

Problem

Using **Regex**, we can easily match or search for patterns in a text. Before searching for a pattern, we have to specify one using some well-defined syntax.

In this problem, you are given a pattern. You have to check whether the syntax of the given pattern is valid.

Note: In this problem, a regex is only valid if you can compile it using the [Pattern.compile](#) method.

Submissions

Input Format

The first line of input contains an integer **N**, denoting the number of test cases. The next **N** lines contain a string of any printable characters representing the pattern of a regex.

Output Format

For each test case, print **Valid** if the syntax of the given pattern is correct. Otherwise, print **Invalid**. Do not print the quotes.

Leaderboard

Sample Input

```
3
([A-Z])(.+)
[AZ[a-z](a-z)
batcatpat(nat
```

Discussions

Sample Output

```
Valid
Invalid
Invalid
```
