

- int leap: the size of the leap
- int game[n]: the array to traverse

Problem

Returns

- boolean: true if the game can be won, otherwise false

Input Format

The first line contains an integer, **q**, denoting the number of queries (i.e., function calls).

The **2 · q** subsequent lines describe each query over two lines:

1. The first line contains two space-separated integers describing the respective values of **n** and **leap**.
2. The second line contains **n** space-separated binary integers (i.e., zeroes and ones) describing the respective values of **game₀, game₁, ..., game_{n-1}**.

Submissions

Constraints

- $1 \leq q \leq 5000$
- $2 \leq n \leq 100$
- $0 \leq \text{leap} \leq 100$
- It is guaranteed that the value of **game[0]** is always 0.

Leaderboard

Sample Input

STDIN	Function
-----	-----
4	q = 4 (number of queries)
5 3	game[] size n = 5, leap = 3 (first query)
0 0 0 0 0	game = [0, 0, 0, 0, 0]
6 5	game[] size n = 6, leap = 5 (second query)
0 0 0 1 1 1	...
6 3	
0 0 1 1 1 0	
3 1	
0 1 0	

Discussions

Editorial

Sample Output

```
YES
YES
NO
NO
```

Explanation

We perform the following **q = 4** queries:

1. For **game = [0, 0, 0, 0, 0]** and **leap = 3**, we can walk and/or jump to the end of the array because every cell contains a 0. Because we can win, we return true.
2. For **game = [0, 0, 0, 1, 1, 1]** and **leap = 5**, we can walk to index 1 and then jump **i + leap = 1 + 5 = 6** units to the end of the array. Because we can win, we return true.

Change Theme Language Java 15

```
1 import java.io.*;
2 import java.util.*;
3
4 public class Solution {
5
6     public static void main(String[] args) {
7         /* Enter your code here. Read input from STDIN. Print output to STDOUT. Your class should be named Solution. */
8     }
9 }
```
