

Problem

For this problem, we have **2** types of queries you can perform on a [List](#):

1. Insert **y** at index **x**:

```
Insert
x y
```

2. Delete the element at index **x**:

```
Delete
x
```

Submissions

Given a list, **L**, of **N** integers, perform **Q** queries on the list. Once all queries are completed, print the modified list as a single line of space-separated integers.

Input Format

The first line contains an integer, **N** (the initial number of elements in **L**).

The second line contains **N** space-separated integers describing **L**.

The third line contains an integer, **Q** (the number of queries).

The **2Q** subsequent lines describe the queries, and each query is described over two lines:

- If the first line of a query contains the String **Insert**, then the second line contains two space separated integers **x y**, and the value **y** must be inserted into **L** at index **x**.
- If the first line of a query contains the String **Delete**, then the second line contains index **x**, whose element must be deleted from **L**.

Discussions

Constraints

- $1 \leq N \leq 4000$
- $1 \leq Q \leq 4000$
- Each element in is a 32-bit integer.

Editorial

Output Format

Print the updated list **L** as a single line of space-separated integers.

Sample Input

```
5
12 0 1 78 12
2
Insert
5 23
Delete
0
```

Sample Output

```
0 1 78 12 23
```

Explanation

L = [12, 0, 1, 78, 12]

Language Java 15

```
1 import java.io.*;
2 import java.util.*;
3
4 public class Solution {
5
6     .... public static void main(String[] args) {
7         .... /* Enter your code here. Read input
8              STDIN. Print output to STDOUT. Your
9              solution should be named Solution. */
9     }
10 }
```
